

## Release

<b>Product:</b>	<b>Windows Host</b>
<b>Version:</b>	18
<b>Build:</b>	2020-104
<b>Shipping from:</b>	25.05.2020
<b>Release Type:</b>	New build

## Introduction

This is a build update to version 18. It contains bug fixes and enhancements. For perpetual licensed users, a new license key is not needed.

## New features and enhancements

- ✓ **Desktop marker utility**  
Various images used by the desktop marker have been integrated to avoid copying those during installation. The utility can be launched by a WiseMo Guest during a remote control session, but may also be run separately on the Host, from e.g.:  
*C:\Program Files (x86)\WiseMo\WiseMo RSM\Remote Desktop Host\WsmDesktopMarker.exe*
- ✓ **Skin support for a Windows based computer**  
It is now possible, via the wisemo.ini file, to specify a Device ID for a Windows computer. This enables those WiseMo Guest modules that support showing Skins, to look-up such Skin, like if it was for a mobile device. An example of use is for remote control of equipment run by a Windows based PC, as a Skin can be created to resemble the equipment or part of the equipment, e.g. a panel with active buttons. The wisemo.ini entry is:  
[HOST]  
skindeviceid=<Skin Device ID>

## Bugs fixed

- ✓ **Clipboard transfer**  
Host accepted clipboard transfer, although denied in privileges.
- ✓ **Remote Management**  
Bug fixed where Remote Management / System Control, from a Browser Guest interface, would not permit lock and log-off, as it incorrectly reported no user was logged-on the Host computer.
